**SEAWEEDS IN THE COAST OF TAMIL NADU, TAXONOMIC CLASSIFICATION OF SEAWEEDS IN TAMIL NADU  
COAST**

**Louis Cojandaraj.A** Research Scholar,

&

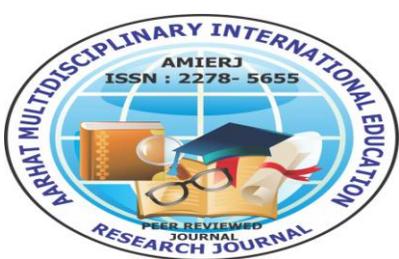

**Dr M.C John Milton**, Associate Professor,

School of Biodiversity and Environment Monitoring Lab,

PG & Research Dept of Advanced Zoology and Biotechnology, Loyola college.

**Marine Algae :**

The marine environment is a rich source of biologically active natural products many of which have not been found in terrestrial sources. The first living organisms have appeared in the sea more than 3,500 million years ago (Argulis L. et al 1982.). These organisms live in complex communities and in close association with other organisms both macro (e.g. algae, sponges, ascidians etc.) and micro (e.g. bacteria, fungi, actinomycetes etc.) organisms (Maudougall 1996.). Marine algae including micro algae photosynthesis, are one of the most primitive photosynthesizing contribute nearly 40% of global autotrophic groups of ecologically and economically important vegetation of oceanic ecosystem with unique life cycle and physiology, nearly 50,000 of seaweeds have been discovered in the marine environment (Filho- Lima et al., 2002).

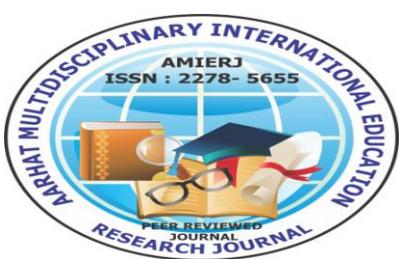

Seaweeds classified into three major groups based on their pigmentation as Phaeophyceae, Rhodophyceae, and chlorophyceae respectively. Brown seaweeds are usually large, and range from the giant kelp that is often 20m long to thick leather like seaweeds from 2-

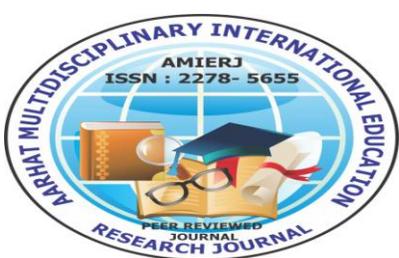

4 m long, to smaller species 30 – 60 cm long. Red seaweeds are usually smaller, generally ranging from a few centimeters to about a meter in length. Green seaweeds are also small, with a similar size range to the red seaweed (Mc Hugh, 2003). The red algae, third group that contributes to the seaweed flora are even microscopic and unicellular (Sheat and Hymes 1980).

#### **Seaweeds in Tamil nadu coastal region:**

Marine algal diversity of Tamilnadu is next only to Gujarat coast in India. As marine algae require substratum to attach and grow, the rocky coasts of Tamilnadu are abound with a rich algal growth. Unlike freshwater algae, marine algae are collected from specific localities. The following are the places coasts in Tamilnadu where one can look for 127 marine algae. Viz., Pulicat, Muttukadu, Pitchavaram and Muthupet (all harbour brackishwater algae); Ennore, Covalam (near Chennai), Mahabalipuram, Tuticorin, Thiruchendur, Idinthakarai, Uvari, Manapad, Cape Comorin, Erwadi, Kilakkarai, Pudumadam, Mandapam, Pamban, Rameswaram and in islands of Gulf of Mannar. Brackish water occurs in Pulicat Lake, Muttukadu, Pitchavaram and Muthupet.
